No. 27-74

TITLE/SIGNIFICANCE:

Two unusually configured radar antennas were observed at the Sha Shih Radar Assembly Plant

COMMENT: Two rectangular antennas were observed for the first time in the test area at the Sha Shih Radar Assembly Plant. One antenna (item 1) was [redacted] high. There are 8 rows of equally spaced elements, [redacted] apart across the width of the antenna and possibly 6 equally spaced rows along its height. Four heavy vertical supports, spaced [redacted], can readily be seen along the horizontal axis of the antenna. The second antenna (item 2) measures [redacted] and was possibly under construction. If deployed these radars would probably be seen at EW/AW electronics facilities.
